

Current-State Workflow - VinFast Long-Distance Route Planning

1. Check battery percent on car/app - 1 min

Handoff: vehicle/app to driver

2. Enter destination in map app - 2 to 3 min

Handoff: map app to driver

3. Find VinFast charging stations on or near route - 5 to 10 min

BOTTLENECK: driver manually filters station options

4. Estimate whether battery can reach station/destination - 3 to 5 min

5. Choose charging stop by distance, location, convenience - 5 min

6. Calculate charging duration and continue-time - 5 to 10 min

BOTTLENECK: manual calculation, missing safety buffer risk

7. Re-check and adjust if battery/traffic/station condition changes

Total: 20 to 30 minutes before trip. Main bottlenecks: steps 3 and 6.
